

```
/* Creates the frame for the application; adds, inits, and starts MPMC applet.  
*  
* @param applet This application. It is called "applet" but we only run  
*    from a standalone jar so it is more of an "application"  
* @param width Width of the application frame in pixels  
* @param height Height of the application frame in pixels
```

```
public static void run(JApplet applet, int width, int height)
```

```
mrmcFrame = new JFrame("iMPMC Version 2p7");  
mrmcFrame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);  
mrmcFrame.getContentPane().add(applet);  
mrmcFrame.pack();  
mrmcFrame.setSize(width, height);
```

```
// We shall override the normal init method.  
// Please refer to the init method in this (sub)class
```

```
applet.init();  
applet.start();  
mrmcFrame.setVisible(true);
```

End
